AMERICAN NATIONAL STANDARD

Approval of an American National Standard requires review by ANSI that the requirements for due process, consensus, and other criteria for approval have been met by the standards developer. Consensus is established when, in the judgment of the ANSI Board of Standards Review, substantial agreement has been reached by directly and materially affected interests. Substantial agreement means more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that a concerted effort be made towards their resolution. The use of American National Standards is completely voluntary; their existence does not in any respect preclude anyone, whether he has approved the standards or not, from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the standards.

The American National Standards Institute does not develop standards and will in no circumstances give an interpretation of any American National Standard. Moreover, no person shall have the right or authority to issue an interpretation of an American National Standard in the name of the American National Standards Institute. Requests for interpretations should be addressed to the secretariat or sponsor whose name appears on the title page of this standard.

Caution Notice: This American National Standard may be revised or withdrawn at any time. The procedures of the American National Standards Institute require that action be taken periodically to reaffirm, revise, or withdraw this standard. Purchasers of American National Standards may receive current information on all standards by calling or writing the American National Standards Institute.

Standard for Performance-Rated Cross-Laminated Timber

APA – The Engineered Wood Association

Approved October 6, 2017
Errata Incorporated
American National Standards Institute
**FOREWORD** (This Foreword is not a part of American National Standard ANSI/APA PRG 320-2017)

This standard provides requirements and test methods for qualification and quality assurance for performance-rated cross-laminated timber (CLT), which is manufactured from solid-sawn lumber or structural composite lumber (SCL) intended for use in construction applications. Product performance classes are also specified.

The development of this consensus American National Standard was achieved by following the *Operating Procedures for Development of Consensus Standards of APA – The Engineered Wood Association*, approved by the American National Standards Institute (ANSI).

Inquiries or suggestions for improvement of this Standard should be directed to APA – The Engineered Wood Association at 7011 South 19th Street, Tacoma, WA 98466, [www.apawood.org](http://www.apawood.org).

1. **SCOPE**

Cross-laminated timber (CLT) panels referenced in this standard are defined in 3.2 and shall be qualified and trademarked in accordance with this standard. This standard provides dimensions and tolerances, performance requirements, test methods, quality assurance, and trademarking for CLT panels.

CLT panels shall be used in dry service conditions, such as in most covered structures, where the average equilibrium moisture content of solid wood is less than 16 percent in the U.S., and is 15 percent or less over a year and does not exceed 19 percent in Canada. CLT panels qualified in accordance with the provisions of this standard are intended to resist the effects of moisture on structural performance as may occur due to construction delays or other conditions of similar severity. Products carrying a trademark of this standard shall be used in accordance with the installation requirements prescribed in the recommendations provided by the CLT manufacturer, an approved agency, and/or its trade association. Finger joining, edge gluing, and face gluing between CLT panels, and camber of CLT panels are beyond the scope of this standard.

The annex contained in this standard is mandatory, while notes and appendices are non-mandatory. This standard incorporates the U.S. customary units as well as the International System of Units (SI). The values given in the U.S. customary units are the standard in the U.S. and the SI values given in parentheses are the standard in Canada.

2. **REFERENCED DOCUMENTS**

This standard incorporates dated references. Subsequent amendments or revisions to these references apply to this standard only when incorporated into this standard by amendments or revisions.

3. **Terminology**

3.1 **Definitions**
See the referenced documents for definitions of terms used in this standard.

3.2 **Terms Specific to This Standard**

* **ASD Reference Design Value**—design value used in the U.S. based on normal duration of load, dry service conditions, and reference temperatures up to 100°F (38°C) for the Allowable Stress Design (ASD)

* **Adhesive**—a substance capable of holding materials together

* **Adherend**—a material held to another material by an adhesive

* **Approved Agency (U.S.)**—an established and recognized agency regularly engaged in conducting tests or furnishing inspection services, when such agency has been approved by regulatory bodies (see Qualified Inspection Agency and Qualified Testing Agency)

* **Approved Agency (Canada)**—an established and recognized agency regularly engaged in conducting certification services, when such agency has been approved by regulatory bodies (see Qualified Certification Agency)

* **Bond**—the attachment at an interface between adhesive and adherends or the act of attaching adherends together by adhesive

* **Bondline**—the layer of adhesive that attaches two adherends
  * **Face bondline**—the bondline joining the wide faces of laminations in adjacent layers
  * **Edge bondline**—the optional bondline joining the narrow faces of adjacent laminations within one layer

* **Characteristic Values**—the structural property estimate, typically a population mean for stiffness properties or a tolerance limit (5th percentile with 75% confidence) for strength properties, as estimated from the test data that is representative of the population being sampled

* **Cross-Laminated Timber (CLT)**—a prefabricated engineered wood product made of at least three orthogonal layers of graded sawn lumber or structural composite lumber (SCL) that are laminated by gluing with structural adhesives

* **CLT Length**—dimension of the CLT panel measured parallel to the major strength direction

  * **Note 1.** The length and width of CLT defined in this standard are based on the CLT panel dimension and may not be related to the end-use, such as wall, roof, and floor, applications.

* **CLT Panel**—a single CLT billet formed by bonding laminations with a structural adhesive

* **CLT Thickness**—dimension of the CLT panel measured perpendicular to the plane of the panel

* **CLT Width**—dimension of the CLT panel measured perpendicular to the major strength direction

* **Curing**—converting an adhesive into a fixed or hardened state by chemical and/or physical action

* **Delamination**—the separation of layers in a laminate due to failure of the adhesive either in the adhesive itself or at the interface between the adhesive and the adherend
**Edge (Panel Edge)**—the narrow face of a panel that exposes the ends or narrow faces of the laminations

**Edgewise Bending**—bending of CLT under loads applied to the panel edge (see Figure 1) creating in-plane bending and edgewise shear, also known as in-plane shear or shear through-the-thickness

**Edge Joint**—a joint of the narrow faces of adjacent laminations within a CLT layer with or without gluing

**Effective Bonding Area**—proportion of the lamination wide face averaged over its length that is able to form a close contact bond upon application of pressure

**FIGURE 1**

**EDGewise BENDING IN THE MAJOR (LEFT) AND MINOR (RIGHT) CLT STRENGTH DIRECTIONS**

**End Joint**—a joint made by gluing of two pieces of laminations within a CLT layer by the ends

**Face**—one of the four longitudinal surfaces of a piece or panel

- **Lamination narrow face**—the face with the least dimension perpendicular to the lamination length
- **Lamination wide face**—the face with the largest dimension perpendicular to the lamination length
- **Panel face**—the face of the CLT length-width plane
**Flatwise Bending**—bending of CLT under transverse loads applied to the panel face (see Figure 2) creating out-of-plane bending and flatwise shear, also known as planar or rolling shear

![Figure 2: Flatwise Bending in the Major (Left) and Minor (Right) CLT Strength Directions](image)

**Lamination**—a piece of sawn lumber or structural composite lumber, including stress rated boards, remanufactured lumber, or end-joined lumber, which has been prepared and qualified for laminating

**Layer**—an arrangement of laminations of the same thickness, grade, and species combination laid out essentially parallel to each other in one plane

  * **Longitudinal**—a layer with the laminations oriented parallel to the major strength direction
  * **Transverse**—a layer with the laminations oriented perpendicular to the major strength direction, also referred to as cross layer

**Layup**—an arrangement of layers in a CLT panel determined by the grade, number, orientation, and thickness of laminations

Note 2. Typical CLT layups in this standard are listed in Annex A. Other (Custom) CLT layups may be established in accordance with 7.2.1.

**LSD Design Value**—design value used in Canada based on standard-term duration of load, dry service conditions, and temperatures up to 122°F (50°C) except for occasional exposures to 150°F (65°C) for the Limit States Design (LSD)

**Major Strength Direction**—general direction of the grain of the laminations in the outer layers of the CLT panel

**Manufacturing Standard**—a document that establishes the minimum requirements for manufacturing practices, staff, facilities, equipment, and specific quality assurance processes, including inspection (in the U.S.) and/or certification (in Canada), by which the product is manufactured

**Mill Specification**—a manufacturing specification based on product evaluation to be used for quality assurance purposes by the manufacturer and the approved agency

**Minor Strength Direction**—perpendicular to the major strength direction of the CLT panel
Qualified Certification Agency (Canada)—an agency meeting the following requirements:

a. has trained personnel to perform product certification in compliance with all applicable requirements specified in this standard,

b. has procedures to be followed by its personnel in performance of the certification,

c. has no financial interest in, or is not financially dependent upon, any single company manufacturing the product being certified,

d. is not owned, operated, or controlled by any such company, and

e. is accredited by a recognized accreditation body under ISO/IEC 17065

Qualified Inspection Agency (U.S.)—an agency meeting the following requirements:

a. has trained personnel to verify that the grading, measuring, species, construction, bonding, workmanship, and other characteristics of the products as determined by inspection in compliance with all applicable requirements specified in this standard,

b. has procedures to be followed by its personnel in performance of the inspection,

c. has no financial interest in, or is not financially dependent upon, any single company manufacturing the product being inspected,

d. is not owned, operated, or controlled by any such company, and

e. is accredited by a recognized accreditation body under ISO/IEC 17020

Qualified Testing Agency—an agency meeting the following requirements:

a. has access to the facilities and trained technical personnel to conduct testing on the characteristics of the products by sampling and testing in compliance with all applicable requirements specified in this standard,

b. has procedures to be followed by its personnel in performance of the testing,

c. has no financial interest in, or is not financially dependent upon, any single company manufacturing the product being tested,

d. is not owned, operated, or controlled by any such company, and

e. is accredited by a recognized accreditation body under ISO/IEC 17025

Recognized Accreditation Body—an organization complying with ISO/IEC 17011 and recognized by the regulatory body having jurisdiction as qualified to evaluate and accredit certification agencies, inspection agencies and/or testing agencies

Remanufactured Lumber—lumber that meets the requirements of Section 5.4 of ANSI A190.1 in the U.S., or NLGA SPS 1, 2, 4, or 6 in Canada

Structural Composite Lumber (SCL)—an engineered wood product that is intended for structural use and bonded with adhesives, and meeting the definition and requirements of ASTM D5456

Wood Failure—the rupturing of wood fibers from the specified block shear test on bonded specimens, measured as the area of wood fiber remaining at the bondline and expressed as a percentage of total area involved in such failure

5. **Panel Dimensions and Dimensional Tolerances**

5.1 **Thickness**

The thickness of CLT shall not exceed 20 inches (508 mm).

5.2 **CLT Dimensional Tolerances**

Dimension tolerances permitted at the time of manufacturing shall be as follows:

- Thickness: ± 1/16 inch (1.6 mm) or 2% of the CLT thickness, whichever is greater
- Width: ± 1/8 inch (3.2 mm) of the CLT width
- Length: ± 1/4 inch (6.4 mm) of the CLT length
Textured or other face or edge finishes are permitted to alter the tolerances specified in this section. The designer shall compensate for any loss in cross-section and/or specified strength of such alterations.

Note 3. The manufacturer may be contacted for recommendations.

5.3 **Squareness**
Unless specified otherwise, the length of the two panel face diagonals measured between panel corners shall not differ by more than 1/8 inch (3.2 mm).

5.4 **Straightness**
Unless specified otherwise, deviation of edges from a straight line between adjacent panel corners shall not exceed 1/16 inch (1.6 mm).

6. **COMPONENT REQUIREMENTS**

6.1 **Laminations—Lumber**

6.1.1 **Lumber species**
Any softwood lumber species or species combinations recognized by American Lumber Standards Committee (ALSC) under PS 20 or Canadian Lumber Standards Accreditation Board (CLSAB) under CSA O141 with a minimum published specific gravity of 0.35, as published in the National Design Specification for Wood Construction (NDS) in the U.S. and CSA O86 in Canada, shall be permitted for use in CLT manufacturing provided that other requirements specified in this section are satisfied. The same lumber species or species combination shall be used within a single layer of CLT. Adjacent layers of CLT shall be permitted to be made of different species or species combinations.

6.1.2 **Lumber grades**
The minimum grade of lumber in the parallel layers of CLT shall be 1200f-1.2E MSR or visual grade No. 2. The minimum grade of lumber in the perpendicular layers of CLT shall be visual grade No. 3. Remanufactured lumber shall be considered as equivalent to solid-sawn lumber when qualified in accordance with Section 5.4 of ANSI A190.1 in the U.S. or SPS 1, 2, 4, or 6 in Canada. Proprietary lumber grades meeting or exceeding the mechanical properties of the lumber grades specified above shall be permitted for use provided that they are qualified in accordance with the requirements of an approved agency.

Note 4. ASTM D5055 provides guidance for proprietary lumber grades used specifically in I-joist applications.

6.1.3 **Lamination sizes**

a. **Major Strength Direction**—The net width of a lamination shall not be less than 1.75 times the lamination thickness for the parallel layers.

b. **Minor Strength Direction**—If the laminations in the perpendicular (cross) layers are not edge bonded, the net width of a lamination shall not be less than 3.5 times the lamination thickness for the perpendicular (cross) layers unless the interlaminar shear strength and creep are evaluated by testing in accordance with Section 8.5.4.1 and the principles of ASTM D6815, respectively.

c. **Both Directions**—The net thickness of a lamination for all layers at the time of gluing shall not be less than 5/8 inch (16 mm) or more than 2 inches (51 mm). In addition, the lamination thickness shall not vary within the same CLT layer.
6.1.4 **Moisture content**
The moisture content of the lumber at the time of CLT manufacturing shall be 12 ± 3%. The moisture content of the SCL at the time of CLT manufacturing shall be 8 ± 3%.

6.1.5 **Face-bonding surface**
All face-bonding surfaces shall be planed prior to face bonding and except for minor local variations, shall be free of raised grain, torn grain, skip, burns, glazing or other deviations from the plane of the surface that might interfere with the contact of sound wood fibers in the bonding surfaces. All face-bonding surfaces shall be free from dust, foreign matter, and exudation that are detrimental to satisfactory bonding.

*Note 5. It may be necessary to plane the lamination surface within 48 hours of face bonding for some wood species.*

6.1.6 **Face-bonding dimensional tolerances**
At the time of face-bonding, variations in thickness across the width of a lamination shall not exceed ±0.008 inch (0.2 mm). The variation in thickness along the length of a lamination shall not exceed ±0.012 inch (0.3 mm). Bow and cup shall not be so great that they will not be straightened out by pressure in bonding.

6.2 **Laminations—Structural Composite Lumber**
SCL products meeting the requirements of ASTM D5456 and the equivalent specific gravity specified in 6.1.1 shall be permitted for use. SCL laminations must also meet the requirements of 6.1.3 through 6.1.6.

6.3 **Adhesives**

a. In the U.S., adhesives used for CLT manufacturing shall meet the requirements of ANSI 405 with the exception that Section 2.1.6 of ANSI 405 (either ASTM D3434 or CSA O112.9) is not required. In addition, adhesives shall be evaluated for heat performance in accordance with Section 6.1.3.4 of DOC PS1.

b. In Canada, adhesives shall meet the requirements of CSA O112.10, and Sections 2.1.3 and 3.3 (ASTM D7247 heat durability) of ANSI 405. In addition, adhesives shall be evaluated for heat performance in accordance with Section 6.1.3.4 of DOC PS1.

c. For use in both the U.S. and Canada, adhesives shall meet both a and b in this section.

*Note 6. The intent of the heat performance evaluation is to determine whether an adhesive has exhibited heat delamination characteristics, which may increase the char rate of the CLT when exposed to fire in certain applications. If heat delamination occurs, the CLT manufacturer is recommended to consult with the adhesive manufacturer and the approved agency to develop an appropriate adjustment in product manufacturing and/or an end-use recommendation.*

6.4 **Lamination Joints**
6.4.1 **General**
The lamination joints of CLT shall meet the requirements specified in this section.

6.4.2 **End joints in laminations**
The strength, wood failure, and durability of lamination end joints shall be qualified in accordance with Section 12.1.3 of ANSI A190.1 and meet the requirements specified therein the U.S., or shall be qualified in accordance with Section 9.5 of CSA O177 and meet the requirements specified therein in Canada.
6.4.3 **Edge and face joints in laminations**

The wood failure and durability of the face and edge (when required for structural performance) joints shall be qualified in accordance with Section 12.1.2 of ANSI A190.1 and meet all requirements, except for the shear strength, specified in Section 12.1.2.(b) of that standard in the U.S., or shall be qualified in accordance with Sections 9.2 and 9.3 of CSA O177 and meet all requirements, except for the shear strength, specified therein in Canada.

7. **CLT PERFORMANCE CRITERIA**

CLT shall meet the performance requirements established in this section.

7.1 **Layup Requirements**

The arrangement of orthogonal layers shall be specified in the manufacturing standard of each CLT plant when qualified in accordance with the requirements specified in this section and by an approved agency.

7.2 **Structural Performance Requirements**

Structural performance shall be evaluated for each CLT layup unless otherwise noted in this section. CLT shall meet the minimum structural performance based on the properties shown in Table 1 multiplied by the section properties provided by the manufacturer and accepted by an approved agency when evaluated and confirmed by test results in accordance with 8.5. CLT panels manufactured with SCL layers, which do not meet Table 1 requirements, shall be qualified in accordance with 7.2.1.

| TABLE 1
| REQUIRED CHARACTERISTIC TEST VALUES\(^{a,b,c,d}\) FOR LAMINATIONS USED IN PRG 320 CLT |
|---------------------------------------------|---------------------------------------------|
| Laminations Used in Major Strength Direction | Laminations Used in Minor Strength Direction |
| CLT Layup | \(f_b\) (psi) | \(E\) (10\(^6\) psi) | \(f_t\) (psi) | \(f_c\) (psi) | \(f_v\) (psi) | \(f_s\) (psi) | \(f_b\) (psi) | \(E\) (10\(^6\) psi) | \(f_t\) (psi) | \(f_c\) (psi) | \(f_v\) (psi) | \(f_s\) (psi) |
| E1 | 4,095 | 1.7 | 2,885 | 3,420 | 425 | 140 | 1,050 | 1.2 | 525 | 1,235 | 425 | 140 |
| E2 | 3,465 | 1.5 | 2,140 | 3,230 | 565 | 185 | 1,100 | 1.4 | 680 | 1,470 | 565 | 185 |
| E3 | 2,520 | 1.2 | 1,260 | 2,660 | 345 | 115 | 735 | 0.9 | 315 | 900 | 345 | 115 |
| E4 | 4,095 | 1.7 | 2,885 | 3,420 | 550 | 180 | 945 | 1.3 | 525 | 1,375 | 550 | 180 |
| V1 | 1,890 | 1.6 | 1,205 | 2,565 | 565 | 185 | 1,100 | 1.4 | 680 | 1,470 | 565 | 185 |
| V2 | 1,835 | 1.4 | 945 | 2,185 | 425 | 140 | 1,050 | 1.2 | 525 | 1,235 | 425 | 140 |
| V3 | 1,575 | 1.4 | 945 | 2,375 | 550 | 180 | 945 | 1.3 | 525 | 1,375 | 550 | 180 |

For SI: 1 psi = 0.006895 MPa

a. See Section 4 for symbols.
b. Tabulated values are test values and shall not be used for design. See Annex A for design properties.
c. Custom CLT layups that are not listed in this table shall be permitted in accordance with 7.2.1.
d. The characteristic values shall be determined as follows from the published reference design value unless otherwise justified by the approved agency:

\[
\begin{align*}
\text{Characteristic Value} &= \text{Published Reference Design Value} \\
&\quad \times \begin{cases} 2.1 & \text{for } f_b \\
1.9 & \text{for } f_t \\
3.15 & \text{for } f_v \\
1.7 & \text{for } f_s \\ 
\end{cases} \\
\end{align*}
\]

Note 7. The “E” designation indicates a CLT layup based on the use of E-rated or MSR laminations in the longitudinal layers and the “V” designation indicates a CLT layup based on the use of visually graded laminations in the longitudinal layers. Visually graded laminations are used in the transverse layers for both “E” and “V” layups. The specific species and grade of the longitudinal layers and the corresponding transverse layers for each “E” and “V” designation are based on the layups shown in Annex A.
7.2.1 Custom CLT layups

Custom CLT layups permitted when approved by an approved agency in accordance with the qualification and mechanical test requirements (see 8.4 and 8.5) specified in this standard. In this case, a unique CLT layup designation shall be assigned by the approved agency if the custom product represents a significant product volume of the manufacturer to avoid duplication with an existing CLT grade designation that has been assigned to other manufacturers.

Note 8. Annex A provides the design capacities for some CLT layups. The custom CLT layups are intended for layups that are different from those provided in Tables 1, A1, A2, A3, and A4, and may include double outer layers or unbalanced layups when clearly identified for installation, as required by the manufacturer and the approved agency.

7.3 Appearance Classifications

CLT panel appearance shall be as agreed to between the buyer and the seller.

8. Qualification and Product Marking

8.1 Qualification Requirements

Required qualification tests for CLT components, such as lumber, adhesives, and end, face, and edge joints are provided in Section 6 and summarized in Table 2. This section provides requirements for plant qualification and CLT qualification tests to meet the structural performance levels specified in Tables A2 and A4.

8.2 Plant Pre-Qualification

8.2.1 General
The CLT plant shall be pre-qualified for the manufacturing factors considered (see 8.2.2) using full-thickness qualification panels of 24 inches (610 mm) or more in the major strength direction and 18 inches (457 mm) or more in the minor strength direction (hereafter referred to as “Pre-qualification panels”). A minimum of two replicate CLT pre-qualification panels shall be manufactured for pre-qualification for each combination of factors considered in 8.2.2. The two replicate CLT pre-qualification panels shall not be extracted from a single full-size CLT panel.

Note 10. A pre-qualification panel of 24 inches (610 mm) or more in the minor strength direction is recommended, particularly for thicker CLT products.

Pre-qualification panels shall be prepared at the facility or at an alternative facility acceptable to the approved agency. All pre-qualification panels shall be:

a. Of the same approximate length and width at the time of pressing;

b. Pressed individually; and

c. Taken from approximately the geometric center of the larger panel, if applicable.

8.2.2 Fabrication of pre-qualification panels
Application of pressure to manufacture pre-qualification panels shall reflect the key characteristics of the manufacturing equipment, including the platen and glue spreader (as applicable) that is or will be used in the facility to be qualified. The applicability of the results shall be documented by the approved agency.

Note 11. For example, pre-qualification panels for facilities using a vacuum press or an air bag should be clamped using a vacuum press or an air bag inserted between the sample and the rigid platen. In addition, the sample preparation facility should distinguish between, for example, roller versus curtain coating and single spread versus double spread, which varies in the uniformity of the adhesive spread.

Factors considered for pre-qualification evaluation shall include assembly time, lumber moisture content, adhesive spread rate, clamping pressure, and wood surface temperature, as specified in the manufacturing standard of the plant and accepted by the approved agency.

8.2.3 Conditioning of pre-qualification panels
Pre-qualification panels shall be stored in an indoor environment for a minimum of 24 hours or until the adhesive has cured sufficiently to permit evaluation, whichever is longer.

Note 12. For panels larger than the specified pre-qualification panel size, the panels may be trimmed to the specified size to facilitate conditioning.

8.2.4 Specimens
Six square/rectangular specimens (three for block shear tests, i.e., “B” specimens and three for delamination tests, i.e., “D” specimens) shall be extracted from each pre-qualification panel at the locations shown in Figure 3 and labeled to indicate the panel number and the specimen position within the panel. If the pre-qualification panel is larger than the specified pre-qualification panel size, the pre-qualification sampling area shall be 24 inches (610 mm) to 36 inches (910 mm) square located at the geometric center of the panel.
8.2.5 Test methods and requirements
The specimens obtained in accordance with 8.2.4 shall be qualified and meet the requirements specified in 6.4.3 of this standard.

8.3 Qualification of Effective Bond Area

8.3.1 General
The manufacturer shall establish visual grading rules for the bonded faces and limit the average glue skip to maintain an average effective bond area of 80% or more.

Note 13. Alternatively, glue skips may be treated as delamination.

The manufacturer’s visual grading rules established to achieve the effective bond area shall include major visual characteristics based on characteristic measurements consistent with standard lumber grading rules.

8.3.2 Sample selection and inspection
Samples shall be drawn from representative production of laminations meeting the manufacturer’s visual grading rules and positioned in accordance with the in-plant manufacturing standard. The layer formed by the laminations shall be verified by the approved agency to provide an effective bond area of 80% or more over any randomly selected area not less than 48 inches (1,220 mm) square.

Note 14. A template with a square opening may be used to facilitate inspection.
8.4 Qualification for Structural Performance
Following plant pre-qualification, a representative sample of CLT panels shall be manufactured for qualification tests in accordance with 8.4.1 and 8.4.2. Depending on the number of layups intended for qualification, a qualification plan shall be developed and accepted by an approved agency in accordance with the principles prescribed in this section.

8.4.1 Required mechanical property qualification
The flatwise bending and flatwise shear properties of CLT layups in both major and minor strength directions shall be tested in accordance with 8.5.3 and 8.5.4 to confirm the design values shown in Table A2 for use in the US or Table A4 for use in Canada, or the design values approved by an approved agency.

8.4.2 Optional mechanical property qualification
When edgewise bending and edgewise shear properties are to be approved by an approved agency, qualification tests shall be conducted in accordance with 8.5.5 and 8.5.6, respectively.

8.5 Mechanical Property Qualification
The design values from required mechanical property qualification (8.4.1) and optional mechanical property qualification (8.4.2) shall be approved by an approved agency in accordance with this section.

8.5.1 Sampling
Test samples shall be representative of typical production and shall be sampled at the manufacturing facility by an approved agency using the layup intended for qualification. The sample size required for stiffness capacities shall be sufficient for estimating the population mean within 5% precision with 75% confidence, or 10 specimens, whichever is greater. In general, a sample size larger than 10 is needed when the coefficient of variation is greater than 13%. The sample size required for strength capacities shall be sufficient for estimating the characteristic value with 75% confidence in accordance with ASTM D2915.

8.5.2 Sample conditioning
CLT panel samples shall be stored in an indoor environment for a minimum of 24 hours or until the adhesive has cured sufficiently to permit evaluation, whichever is longer. The CLT samples at the time of mechanical tests shall have an average moisture content of not less than 8%.

8.5.3 Flatwise bending properties
Flatwise bending stiffness and bending moment capacity (resistance) shall be evaluated in accordance with 8.5.3.1 and 8.5.3.2

8.5.3.1 Flatwise bending test methods
Flatwise bending tests shall be conducted in both major and minor strength directions in accordance with the third-point load method of Sections 4 through 12 of ASTM D198 or Section 8 of ASTM D4761 using the specimen width of not less than 12 inches (305 mm) and the on-center span equal to approximately 30 times the specimen depth for the tests in the major strength direction and approximately 18 times the specimen depth for the tests in the minor strength direction. The weight of the CLT panel is permitted to be included in the determination of the flatwise bending moment capacity (resistance).
8.5.3.2 Flatwise bending qualification requirements
In the U.S. and Canada, the average flatwise bending stiffness determined from qualification tests shall equal or exceed the published flatwise bending stiffness \([\text{E}I]_{\text{eff},0}\text{ or } [\text{E}I]_{\text{eff},90}\).

In the U.S., the characteristic flatwise bending moment capacity determined from qualification tests shall equal or exceed the published ASD reference flatwise bending moment capacity \([FbS]_{\text{eff},0}\text{ or } [FbS]_{\text{eff},90}\) times 2.1. In Canada, the characteristic flatwise bending moment resistance determined from qualification tests shall equal or exceed the published LSD flatwise bending resistance \([f_{bS}]_{\text{eff},0}\text{ or } [f_{bS}]_{\text{eff},90}\) divided by 0.96.

8.5.4 Flatwise shear properties
Flatwise shear stiffness and capacity (resistance) shall be evaluated in accordance with 8.5.4.1 and 8.5.4.2.

8.5.4.1 Flatwise shear test methods
Flatwise shear stiffness tests shall be conducted in both major and minor strength directions in accordance with Sections 45 through 52 of ASTM D198.

Flatwise shear tests shall be conducted in both major and minor strength directions in accordance with the center-point load method of Sections 4 through 12 of ASTM D198 or Section 7 of ASTM D4761 using the specimen width of not less than 12 inches (305 mm) and the on-center span equal to 5 to 6 times the specimen depth. The bearing length shall be sufficient to avoid bearing failure, but not greater than the specimen depth. All specimens are to be cut to length with no overhangs allowed.

8.5.4.2 Flatwise shear qualification requirements
In the U.S. and Canada, the average flatwise shear stiffness determined from qualification tests shall equal or exceed the published shear stiffness in flatwise bending \([\text{GA}]_{\text{eff},0}\text{ or } [\text{GA}]_{\text{eff},90}\).

In the US, the characteristic flatwise shear capacity determined from qualification tests shall equal or exceed the published ASD reference flatwise shear capacity \((V_s,0)\text{ or } (V_s,90)\) times 2.1. In Canada, the characteristic flatwise shear resistance determined from qualification tests shall equal or exceed the published LSD flatwise shear resistance \((v_s,0)\text{ or } (v_s,90)\) divided by 0.96.

8.5.5 Edgewise bending properties
Edgewise bending stiffness and bending moment capacity (resistance) shall be permitted to be evaluated in accordance with 8.5.5.1 and 8.5.5.2. The volume, creep and load duration effects of edgewise bending capacity (resistance) shall be evaluated in accordance with the principles of Sections 7.4.1 and 7.4.2 of ASTM D5456.

8.5.5.1 Edgewise bending test methods
Bending tests shall be conducted edgewise in both major and minor strength directions in accordance with the third-point load method of Sections 4 through 12 of ASTM D198 or Section 6 of ASTM D4761 using the specimen depth of not less than 12 inches (305 mm) and the on-center span equal to approximately 18 times the specimen depth. The weight of the CLT panel is permitted to be included in the determination of the edgewise bending moment capacity (resistance).

8.5.5.2 Edgewise bending qualification requirements
In the U.S. and Canada, the average edgewise bending stiffness determined from qualification tests divided by the calculated moment of inertia \((l_{e,0}\text{ or } l_{e,90})\) shall equal or exceed the published edgewise bending modulus of elasticity \((E_{e,0}\text{ or } E_{e,90})\).
In the U.S., the characteristic edgewise bending moment capacity determined from qualification tests shall equal or exceed the published ASD reference edgewise bending stress \( F_{b,e,0} \) or \( F_{b,e,90} \) multiplied by the calculated edgewise section modulus \( S_{e,0} \) or \( S_{e,90} \) and an adjustment factor of 2.1. In Canada, the characteristic edgewise bending moment resistance determined from qualification tests shall equal or exceed the published LSD specified edgewise bending strength \( f_{b,e,0} \) or \( f_{b,e,90} \) multiplied by the calculated edgewise section modulus \( S_{e,0} \) or \( S_{e,90} \) and divided by an adjustment factor of 0.96.

### 8.5.6. Edgewise shear properties

Edgewise shear stiffness and capacity (resistance) shall be permitted to be evaluated in accordance with 8.5.6.1 and 8.5.6.2.

#### 8.5.6.1 Edgewise shear test methods

Edgewise shear stiffness tests shall be conducted in both major and minor strength directions in accordance with Sections 45 through 52 of ASTM D198.

Edgewise shear capacity (resistance) tests shall be conducted in both major and minor strength directions in accordance with the full-scale test method specified in Annex A3 of ASTM D5456. The web thickness of the I-shaped cross section shall be the CLT thickness. The specimen shall contain at least one edge joint, as applicable, in the middle 1/3 of the specimen depth.

**Note 15:** Tests have demonstrated that reinforcing the specimens with flanges (creating I-shaped beams) is necessary for development of the shear failure mode. Conducting preliminary tests to confirm the failure mode is recommended prior to producing the entire batch of I-shaped test specimens. Tests have also demonstrated that it may not be possible to fail the 7-ply or thicker CLT beams in shear in both minor and major strength directions. High-capacity testing apparatus is needed in all cases.

#### 8.5.6.2 Edgewise shear qualification requirements

For use in the US or Canada, the average edgewise shear stiffness determined from qualification tests divided by the gross thickness of CLT \( t_p \) shall equal or exceed the published modulus of rigidity (shear modulus) in edgewise bending \( G_{e,0} \) or \( G_{e,90} \).

In the US, the characteristic edgewise shear capacity determined from qualification tests shall equal or exceed the published ASD reference edgewise shear capacity \( F_{v,e,0} \) or \( F_{v,e,90} \) multiplied by an adjustment factor of 2.1. In Canada, the characteristic edgewise shear resistance determined from qualification tests shall equal or exceed the published LSD edgewise shear resistance \( f_{v,e,0} \) or \( f_{v,e,90} \) divided by an adjustment factor of 0.96.
8.6 Process Changes Qualification
Material changes to the manufacturing process or facilities shall be subjected to subsequent qualification testing. The requirements of 8.2 through 8.5 shall be reapplied for material changes listed or equivalent to that listed in Table 3.

a. It is recommended that changes involving two or more manufacturing parameters be subjected to evaluation in accordance with 8.4 and 8.5.

8.7 Mill Specification
Upon conformance with the requirements specified in this standard, a manufacturing specification or documentation unique to the product and mill shall be written based on product evaluation. This specification shall be used for quality assurance purposes by the manufacturer and the approved agency. Reference values shall be established during product evaluation or from applicable performance requirements in this standard.

8.8 Certification and Trademarking

8.8.1 Certification
CLT products represented as conforming to this standard shall bear the stamp of an approved agency which (1) either inspects the manufacturer or (2) has tested a random sampling of the finished products in the shipment being certified for conformance with this standard.

8.8.2 Product marking
CLT products represented as conforming to this standard shall be identified with marks containing the following information:

a. CLT grade qualified in accordance with this standard;
b. The CLT thickness or identification;
c. The mill name or identification number;
d. The approved agency name or logo;
e. The symbol of “ANSI/APA PRG 320” signifying conformance to this standard;
f. Any manufacturer’s designations which shall be separated from the grade-marks or trademarks of the approved agency by not less than 6 inches (152 mm); and

g. “Top” stamp on the top face of custom CLT panels used for roof or floor if manufactured with an unbalanced layup.

8.8.3 Frequency of marking
Non-custom and other required marks in this section shall be placed on standard products at intervals of 8 feet (2.4 m) or less in order that each piece cut from a longer piece will have at least one of each of the required marks.

8.8.4 Custom products
For products manufactured to meet specific job specifications (custom products), the marking shall be permitted to contain information less than that specified in 8.8.2. However, custom products shall bear at least one mark containing a required identification. When long CLT products shipped to a job are to be cut later into several members for use in the structure, the frequency of marking required in 8.8.3 shall be followed.

8.8.5 Voiding marks
CLT products originally marked as conforming to this standard but subsequently rejected as not conforming thereto shall have any reference to the standard obliterated or voided by the manufacturer.

Note 16. This can be performed by blocking out the stamp with permanent black ink or light sanding.

9. QUALITY ASSURANCE

9.1 Objectives
This section is intended for use with CLT products that have qualified for trademarking under this standard. The purpose of this section is to assure product quality by detecting changes in properties that may adversely affect the CLT performance. In all cases, the criteria to which the CLT products are tested shall be provided in the Mill Specification or equivalent document.

9.2 Process Control
On-going evaluation of the process properties listed in this section shall be performed to confirm that the CLT quality remains in satisfactory compliance to the product specification requirements. Sampling methods and quality assurance testing shall be documented in an in-plant manufacturing standard and accepted by the approved agency. All processes and test records relevant to the production shall be retained based on the manufacturer’s record retention policy and are subject to audit by the approved agency. Production shall be held pending results of the quality assurance testing on representative samples.

9.3 End, Face, and Edge Joints in Laminations
The lamination end joints, face joints, and edge joints (when applicable) shall be sampled and tested for on-going quality assurance in accordance with Table 3 of ANSI A190.1 and meet the strength (required for end joints only), wood failure, and durability requirements specified therein in the U.S., or shall be sampled and tested in accordance with Section 7 of CSA O122 and meet the strength (required for end joints only), wood failure, and durability requirements specified therein in Canada. Special considerations for face bonding of the CLT panel as a whole are provided in 9.3.1 through 9.3.3 of this standard.
9.3.1 **Effective bonding area**
On-grade lumber shall be laid up to maintain an effective bonding area of not less than 80% on surfaces to be bonded for each bondline.

*Note 17.* To maintain an effective bond area, laminations in cross-plies may need to be oriented such that the bark and pith faces of adjacent pieces are generally alternated.

9.3.2 **Lamination grade limits**
Grade limits intended to limit the amount of lamination warp that will not be corrected upon application of pressure shall be qualified in accordance with 8.3.

9.3.3 **Glue skip in the face bondline**
The average glue skip in a face bondline shall not exceed the level established to maintain the effective bonding area specified in 9.3.1. Glue skips are not assessed as delamination unless the inclusion of such skips does not invalidate the delamination requirements.

9.4 **Finished Production Inspection**
All production shall be inspected visually, and/or by measurements or testing for conformance to this standard with the following attributes:

- **a.** Dimensions (width, depth and length);
- **b.** Shape, including straightness and squareness;
- **c.** Type, quality and location of structural bond lines;
- **d.** Appearance classification;
- **e.** Layup, including lumber species and grades, placement, and orientation;
- **f.** Moisture content; and
- **g.** Application of the appropriate marks.

9.5 **Minor Variations**
A product is considered conforming to this standard when minor variations of a limited extent in non-critical locations exist, or when structural damage or defects have been repaired and, in the judgment of a qualified person, the product is structurally adequate for the use intended. The identity of the product and the nature of the minor variation shall be documented and provided to the designer of record upon request. A qualified person is one who is familiar with the job specifications and applicable design requirements and has first-hand knowledge of the manufacturing process.
This Annex provides the design properties for CLT layups listed in Table 1, which represent the production intended for use by the CLT manufacturers in North America and are based on the following layups:

- **E1**: 1950f-1.7E Spruce-pine-fir MSR lumber in all longitudinal layers and No. 3 Spruce-pine-fir lumber in all transverse layers
- **E2**: 1650f-1.5E Douglas fir-Larch MSR lumber in all longitudinal layers and No. 3 Douglas fir-Larch lumber in all transverse layers
- **E3**: 1200f-1.2E Eastern Softwoods, Northern Species, or Western Woods MSR lumber in all longitudinal layers and No. 3 Eastern Softwoods, Northern Species, or Western Woods lumber in all transverse layers
- **E4**: 1950f-1.7E Southern pine MSR lumber in all longitudinal layers and No. 3 Southern pine lumber in all transverse layers
- **V1**: No. 2 Douglas fir-Larch lumber in all longitudinal layers and No. 3 Douglas fir-Larch lumber in all transverse layers
- **V2**: No. 1/No. 2 Spruce-pine-fir lumber in all longitudinal layers and No. 3 Spruce-pine-fir lumber in all transverse layers
- **V3**: No. 2 Southern pine lumber in all longitudinal layers and No. 3 Southern pine lumber in all transverse layers

</table>

For SI: 1 psi = 0.006895 MPa

a. See Section 4 for symbols.

b. Tabulated values are ASD reference design values and not permitted to be increased for the lumber size and flat use adjustment factors in accordance with the NDS. The design values shall be used in conjunction with the section properties provided by the CLT manufacturer based on the actual layup used in manufacturing the CLT panel (see Table A2).

c. Custom CLT layups that are not listed in this table shall be permitted in accordance with 7.2.1.

d. The tabulated E values are published E for lumber. For calculating the CLT design properties shown in Table A2, the transverse E of the lamination is assumed to be E/30, the longitudinal G of the lamination is assumed to be E/16, and the transverse G of the lamination is assumed to be longitudinal G/10.
The ASD reference design capacities for these CLT layups with 3, 5, and 7 layers are provided in Table A2. These capacities were derived analytically using the Shear Analogy Model\(^2\) (the calculated moment capacities in the major strength direction were further multiplied by a factor of 0.85 for conservatism) and validated by testing. The lamination thicknesses are as tabulated. The ASD reference tensile and compressive capacities will be developed and added to future editions of this standard.

![Table A2](image)

Note A1. The rounding rules in Table A2 are as follows:

- \(F_{bS}\) (lbf-ft/ft) and \(V_y\) (lbf/ft)—Nearest 25 for values greater than 2,500, nearest 10 for values between 1,000 and 2,500, or nearest 5 otherwise.
- \(EI\) (lbf-in.^2/ft) and \(GA\) (lbf/ft)—Nearest 10^6 for values greater than 10^7, nearest 10^5 for values between 10^6 and 10^7, or nearest 10^4 otherwise.

For use in Canada, the lamination LSD design properties are provided in Table A3 and the CLT LSD design resistances are shown in Table A4. The LSD design resistances are not compatible with the ASD reference design capacities used in the U.S. Since there are no published LSD specified strength and modulus of elasticity for Southern pine lumber in Canada, the CLT Layups E4 and V3 are not listed in Tables A3 and A4.

</table>

For SI: 1 mm = 0.03937 in.; 1 m = 3.28 ft; 1 N = 0.2248 lbf

- **a.** See Section 4 for symbols.
- **b.** This table represents one of many possibilities that the CLT could be manufactured by varying lamination grades, thicknesses, orientations, and layer arrangements in the layup.
- **c.** Custom CLT layups that are not listed in this table shall be permitted in accordance with 7.2.1.
Note A2. The rounding rules in Table A4 are as follows:

- $f_y$ (N-mm/m) and $GA$ (N/m)—Nearest $10^6$ for values greater than $10^7$, nearest $10^5$ for values between $10^6$ and $10^7$, or nearest $10^4$ otherwise.
- $V_s$ (kN/m)—Nearest 1 for values greater than 10, nearest 0.1 for values between 10 and 1, or nearest 0.01 otherwise.
- $EI$ (N-mm$^2$/m)—Nearest $10^9$ for values greater than $10^{10}$, nearest $10^8$ for values between $10^9$ and $10^{10}$, or nearest $10^7$ otherwise.

**APPENDIX A. EXAMPLES OF CLT APPEARANCE CLASSIFICATIONS (NON-MANDATORY)**

This appendix contains examples of CLT appearance classifications for reference only. These requirements are based on the appearance at the time of manufacturing. The actual CLT panel appearance requirements are recommended to be agreed upon between the buyer and the seller.

A1. **Architectural Appearance Classification**

An appearance classification normally suitable for applications where appearance is an important, but not overriding consideration. Specific characteristics of this classification are as follows:

- In exposed surfaces, all knot holes and voids measuring over $3/4$ inch (19 mm) are filled with a wood-tone filler or clear wood inserts selected for similarity with the grain and color of the adjacent wood.
- The face layers exposed to view are free of loose knots and open knot holes are filled.
- Knot holes do not exceed $3/4$ inch (19 mm) when measured in the direction of the lamination length with the exception that a void may be longer than $3/4$ inch (19 mm) if its area is not greater than $1/2$ in.$^2$ (323 mm$^2$).
- Voids greater than $1/16$ inch (1.6 mm) wide created by edge joints appearing on the face layers exposed to view are filled.
- Exposed surfaces are surfaced smooth with no misses permitted.

A2. **Industrial Appearance Classification**

An appearance classification normally suitable for use in concealed applications where appearance is not of primary concern. Specific characteristics of this grade are as follows:

- Voids appearing on the edges of laminations need not be filled.
- Loose knots and knot holes appearing on the face layers exposed to view are not filled.
- Members are surfaced on face layers only and the appearance requirements apply only to these layers.
- Occasional misses, low laminations or wane (limited to the lumber grade) are permitted on the surface layers and are not limited in length.
APPENDIX B. HISTORY OF STANDARD (NON-MANDATORY)

In March 2010, the APA Standards Committee on Standard for Performance-Rated Cross-Laminated Timber was formed to develop a national standard under the consensus processes accredited by the American National Standards Institute (ANSI). This national consensus standard, designated as ANSI/APA PRG 320, is developed based on broad input from around the world. It should be especially recognized that this standard incorporates draft standards that were developed by FPInnovations in Canada, as part of the joint effort between the U.S. and Canada in the development of a bi-national CLT standard. The first version of this standard was approved by ANSI for publication on December 20, 2011. Subsequent revisions resulted in the publication of ANSI/APA PRG 320-2012 and this standard.
The names of the ANSI/APA PRG 320 Committee members when this version of the standard is published are as shown below. The current list of the committee membership is available from the committee secretariat upon request.
