1. Basis of the product report:
   - 2012 IRC: Sections R104.11 Alternative materials, and R502.1.5, R602.1.2, and R802.1.4 Structural glued-laminated timber
   - ASTM D3737-12 and D3737-08 recognized by the 2018 and 2015 IBC and IRC, and 2012 IBC and IRC, respectively
   - APA Glulam Design Specification, Y117
   - APA Glulam Layup Combinations
   - APA Report T2006P-65A and other qualification data

2. Product description:
   Calvert GL 3000 glulam beams are used as beams, headers, rafters, or purlins, and are manufactured with the EWS 30F-E2M3/SP balanced layup combination using laminated veneer lumber (LVL), as permitted by ANSI A190.1, as the tension and compression laminations, and Southern pine laminations in the remainder of the beam. The LVL laminations are supplied by manufacturers recognized by APA and identified in Calvert’s in-plant manufacturing standard approved by APA. The LVL complies with the control values listed in the manufacturing standard and is manufactured in full length and width laminations, and in thicknesses up to 2 inches from wood veneers. All veneer grain is parallel to the length of the billets. The veneers are bonded with exterior-type adhesives, which comply with the requirements of Service Class B (Exterior) of ASTM D2559.

3. Design properties:
   Table 1 lists the allowable design properties for Calvert GL 3000 glulam beams. The allowable loads for Calvert GL 3000 shall be in accordance with the recommendations provided by the manufacturer (www.calvertglulam.com) and APA Data File: Glued Laminated Beam Design Tables, Form S475 (www.apawood.org/resource-library), as applicable.

4. Product installation:
   Calvert GL 3000 glulam beams shall be installed in accordance with the recommendations provided by the manufacturer and APA Technical Note: Glulam Connection Details, Form T300 (see link above). Permissible field notching and drilling shall be in accordance with the recommendations provided by the manufacturer and APA Technical Note: Field Notching and Drilling of Glued Laminated Timber Beams, Form S560 (see link above).

5. Fire-rated assemblies:
   Fire-rated assemblies shall be constructed in accordance with the recommendations provided by the manufacturer and APA Design/Construction Guide: Fire-Rated Systems,
Form W305 (see link above). For one- or two-hour rated glulam beams, the Calvert GL 3000 glulam beams shall be constructed in accordance with ANSI A190.1 and designed in accordance with the recommendations provided by the manufacturer and APA Technical Note: Calculating Fire Resistance of Glulam Beams and Columns, Form Y245 (see link above) or Chapter 16 of the 2018 National Design Specification for Wood Construction (NDS).

6. Limitations:
   a) Calvert GL 3000 glulam beams shall be designed in accordance with the code using the design properties specified in this report or APA Y117 (based on the properties published for the 30F-E2M3 layup combination).
   b) Calvert GL 3000 glulam beams shall have a minimum depth of 7-1/4 inches.
   c) Calvert GL 3000 glulam beams are produced at Calvert Company’s facilities in Vancouver and Washougal, Washington, under a quality assurance program audited by APA.
   d) This report is subject to re-examination in one year.

7. Identification:
   Calvert GL 3000 glulam beams described in this report are identified by a label bearing the manufacturer’s name (Calvert) and/or trademark, the APA assigned plant number (1010 for the Vancouver, Washington plant or 1035 for the Washougal, Washington plant), the product standard (ANSI A190.1), the APA logo, the report number PR-L269, and a means of identifying the date of manufacture.
Table 1. Allowable design Values for Calvert GL 3000 Glulam Beams for Normal Duration of Load

</tr>
</tbody>
</table>

(1) The combinations in this table are intended primarily for members stressed in bending due to loads applied perpendicular to the wide faces of the laminations. Allowable design values are tabulated, however, for loading both perpendicular and parallel to the wide faces of the laminations.

(2) The tabulated allowable design values are for normal duration of loading. For other durations of loading, see the applicable building codes. The tabulated allowable design values are for dry conditions of use. For wet conditions of use, multiply the tabulated values by the wet use factor shown at the bottom of the table.

(3) SP = Southern pine; LVL = laminated veneer lumber per the manufacturing standard.

(4) The balance (B) layup is intended primarily for multiple-span or cantilevered beam applications, but may be used in simple-span applications.

(5) The values of $F_{u}$ are based on members 5-1/8 inches in width by 12 inches in depth by 21 feet in length. For members with a larger volume, $F_{u}$ shall be multiplied by a volume factor, $C_{V} = \left(\frac{0.125b}{b}\right)^{1/3} \left(\frac{12d}{d}\right)^{1/3} \left(\frac{21L}{L}\right)^{1/6}$, where $b$ is the beam width (in.), $d$ is the beam depth (in.), and $L$ is the beam length between the points of zero moment (ft).

(6) For non-prismatic members, members subject to impact or cyclic loading, or shear design of bending members at connections (NDS 3.4.3.3), the $F_{u}$ and $F_{s}$ values shall be multiplied by a factor of 0.72. The tabulated $F_{u}$ values are for timbers with laminations made from a single piece of lumber across the width or multiple pieces that have been edge bonded. For timber manufactured from multiple piece laminations (across width) that are not edge bonded, value shall be multiplied by 0.4 for members with 5, 7, or 9 laminations or by 0.5 for all other members.

(7) The tabulated $E_{v}$ values include true $E$ (also known as "shear-free $E"), apparent $E$, and $E$ for beam stability calculation (NDS 3.3.3.8). For calculating beam deflections, the tabulated $E_{v}$ values shall be used unless the shear deflection is determined in addition to bending deflection based on the tabulated $E_{min}$. The axial modulus of elasticity, $E_{ax}$ and $E_{ax} \text{ max}$, shall be equal to the tabulated $E_{true}$ and $E_{s}$ values.

(8) The values of $F_{u}$ are based on members 12 inches in depth. For depths less than 12 inches, $F_{u}$ shall be permitted to be increased by multiplying by the flat use factor, $(12/d)^{1/2}$, where $d$ is the beam depth in inches. When $d$ is less than 3 inches, use the size adjustment factor for 3 inches.

(9) The beam depths are limited to 7-1/4 to 24 inches.

(10) The values of $F_{u}$ shall be permitted to be increased to the published allowable compressive stress perpendicular to grain of the outermost laminated veneer lumber in the plank (flatwise) orientation.
APA – The Engineered Wood Association is an approved national standards developer accredited by American National Standards Institute (ANSI). APA publishes ANSI standards and Voluntary Product Standards for wood structural panels and engineered wood products. APA is an accredited certification body under ISO/IEC 17065 by Standards Council of Canada (SCC), an accredited inspection agency under ISO/IEC 17020 by International Code Council (ICC) International Accreditation Service (IAS), and an accredited testing organization under ISO/IEC 17025 by IAS. APA is also an approved Product Certification Agency, Testing Laboratory, Quality Assurance Entity, and Validation Entity by the State of Florida, and an approved testing laboratory by City of Los Angeles.
