*REPRESENTING THE ENGINEERED WOOD INDUSTRY*

# **Evaluation of Fire-Retardant Treated Laminated Veneer Lumber**

Final Report – Part 1 of 2  
USDA Joint Venture Agreement 16-JV-11111135-079

## **Executive Summary**

This report contains test results for the fire-retardant-treatment (FRT) and hygrothermal effects on laminated veneer lumber (LVL). This is the first part of the collaborative research project between APA – The Engineered Wood Association, Tacoma, WA, and USDA Forest Products Laboratory (FPL), Madison, WI. The second part of this project is related to FRT structural glued laminated timber (glulam) and the results are provided in a separate research report.

Selected mechanical properties, including tension, edgewise bending, and edgewise shear of the FRT LVL treated with the American Wood Protection Association (AWPA) P49 fire retardant were evaluated in this study. The combined FRT and hygrothermal effects on the LVL volume effect factor were also evaluated. These results are used to support the development of an ASTM standard for FRT LVL.

This work was a joint research project of APA – The Engineered Wood Association and the USDA FPL. This research was supported in part by funds provided by the USDA FPL, which is acknowledged and greatly appreciated by the project team. The project team also appreciated the contribution of Arch Wood Protection Inc. for providing the P49 fire-retardant treatment.

## **1. Introduction**

Interests in using engineered wood products in Type III construction in the U.S. have been rising in recent years. The wood industry has been heavily engaged in the promotion of multi-family and light commercial construction in which wood-frame Type III construction predominates. Type III construction, based on the definition of the International Building Code (IBC) is “that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are of any material permitted by this code,” except that fire-retardant-treated (FRT) wood framing complying with the IBC is permitted within exterior wall assemblies of a 2-hour rating or less.

As part of the Type III construction, the exterior bearing walls of wood-frame construction must be FRT wood with a 2-hour fire rating, and the floor framing is required to be 1-hour fire rated. At the intersection of the 2-hour wall and 1-hour floor, where the floor framing is attached to the wall with joist hangers, a popular solution is to use solid structural rimboard or header to provide the needed load transfer mechanism. Due to the requirement for continuity on the 2-hour fire rating, the rimboard or wall header is a good fit for structural glued laminated timber (glulam) and structural composite lumber (SCL) products. Unfortunately, this market demand has faced a strong technical challenge due to the lack of consensus-based evaluation standards or product specifications for FRT glulam and SCL. ASTM and AWPA have published FRT test standards and FRT product specifications for lumber and plywood, but not glulam and SCL. For SCL, due to the different treatment requirements and the market size, this study focused on laminated veneer lumber (LVL).

## **2. Objective**

The objective of this work was to develop ASTM standards for the evaluation of fire-retardant treated (FRT) LVL in support of wood-frame construction, especially in Type III construction. In this study, fire-retardant treatment was performed by a treater using the American Wood Protection Association (AWPA) P49 standard, *Standard for Fire Retardant FR-1*. Full scale tension and edgewise bending tests and also block shear tests were conducted on matched samples for 3100F<sub>b</sub>-2.0E LVL to evaluate both fire-retardant treatment and hygrothermal effects. In addition, full-size LVL specimens of four different sizes were tested in edgewise bending after fire-retardant treatment to evaluate the FRT effect on the LVL volume effect under hygrothermal conditions. Adhesive durability tests were conducted on untreated materials to evaluate the LVL bond durability.

## **3. Materials**

3100F<sub>b</sub>-2.0E LVL billets at a nominal thickness of 1-3/4 inches were shipped by a commercial LVL plant to the APA Research Center in Tacoma, Washington in August 2016. These materials were cut based on the test plan shown in Tables 1 through 3. After being prepared, groups TTA, TTH, TBA, TBH1, TBH2, TBH3, and TBH4 were shipped to a fire-retardant treatment company for AWPA P49 treatment. After being treated, these materials were shipped back to APA. Then groups UTA, TTA, UBA, and TBA were conditioned at standard conditions ( $68 \pm 11^\circ\text{F}$  and  $65 \pm 5\%$  relative humidity) in accordance with ASTM D5456, *Standard Specification for Evaluation of Structural Composite Lumber Products*. All the other groups, i.e. UTH, TTH, UBH1, TBH1, UBH2, TBH2, UBH3, TBH3, UBH4, and TBH4, were shipped to the USDA Forest Products Laboratory (FPL) for hygrothermal conditioning ( $150 + 4^\circ\text{F}$  and 50% or higher relative humidity for  $108 \pm 3$  days in accordance with ASTM D5664, *Standard Test Method for Evaluating the Effects of Fire-Retardant Treatments and Elevated Temperatures on Strength Properties of Fire-Retardant Treated Lumber*), and testing. Included in this study were

four different LVL sizes that were tested in edgewise bending after fire-retardant treatment to study the volume effect for untreated and treated LVL.

Table 1. Tension tests

Type <sup>(a)</sup>	Quantity	Treatment	Conditioning	Dimension	Test Lab
UTA (Untreated Control)	30	NA	Standard	1-3/4 inches x 5-1/2 inches x 9 feet	APA
TTA (Treated and Matched with UTA)	30	P49			
UTH (Untreated Control)	30	NA	Hygrothermal		FPL
TTH (Treated and Matched with UTH)	30	P49			

<sup>(a)</sup> First letter: U (untreated) or T (treated); Second letter: T (tension); Third letter: A (standard condition) or H (hygrothermal condition)

Table 2. Edgewise bending tests

Type <sup>(a)</sup>	Quantity	Treatment	Conditioning	Dimension	Test Lab
UBA (Untreated Control)	30	NA	Standard	1-3/4 inches x 3-1/2 inches x 6 feet	APA
TBA (Treated and Matched with UBA)	30	P49			
UBH1 (Untreated Control Size 1)	30	NA	Hygrothermal	1-3/4 inches x 3-1/2 inches x 6 feet	FPL
TBH1 (Treated Size 1 and Matched with UBH1)	30	P49			
UBH2 (Untreated Control Size 2)	30	NA	Hygrothermal	1-3/4 inches x 5-1/2 inches x 8 feet	
TBH2 (Treated Size 2 and Matched with UBH2)	30	P49			
UBH3 (Untreated Control Size 3)	30	NA	Hygrothermal	1-3/4 inches x 7-1/4 inches x 12 feet	
TBH3 (Treated Size 3 and Matched with UBH3)	30	P49

<sup>(a)</sup> First letter: U (untreated) or T (treated); Second letter: B (bending); Third letter: A (standard condition) or H (hygrothermal condition)

Table 3. Edgewise block shear tests

Type <sup>(a)</sup>	Quantity	Treatment	Conditioning	Dimension	Test Lab
USA (Untreated Control)	30	NA	Standard	1-3/4 inches x 1-3/4 inches x 3 inches	APA
TSA (Treated and Matched with USA)	30	P49			
TSH (Treated and Matched with UTH)	30	P49	Hygrothermal		FPL

<sup>(a)</sup> First letter: U (untreated) or T (treated); Second letter: S (shear); Third letter: A (standard condition) or H (hygrothermal condition)

## 4. Methods

### 4.1 Tension Tests

The tension tests were conducted in accordance with Section 6.5.2 of ASTM D5456, using a 4-ft gauge length. Untreated (UTA and UTH) and treated (TTA and TTH) samples were tested under both standard and hygrothermal conditions.

### 4.2 Edgewise Bending Tests

The edgewise bending tests were conducted in accordance with Section 6.5.1 of ASTM D5456 as shown in Figure 1. The neutral axis deflection at mid-span was measured using a linear potentiometer. The total applied load and mid-span deflection were recorded by a computer data acquisition system. Dimensions for the specimens are listed in Table 4. Treated (TBA) and untreated (UBA) samples were tested to evaluate the fire-retardant treatment effect on LVL bending properties under standard conditions. Four different sizes of treated and untreated samples (UBH1 and TBH1, UBH2 and TBH2, UBH3 and TBH3, and UBH4 and TBH4) have been tested to evaluate the influence of the fire-retardant treatment on the volume effect under hygrothermal conditions.

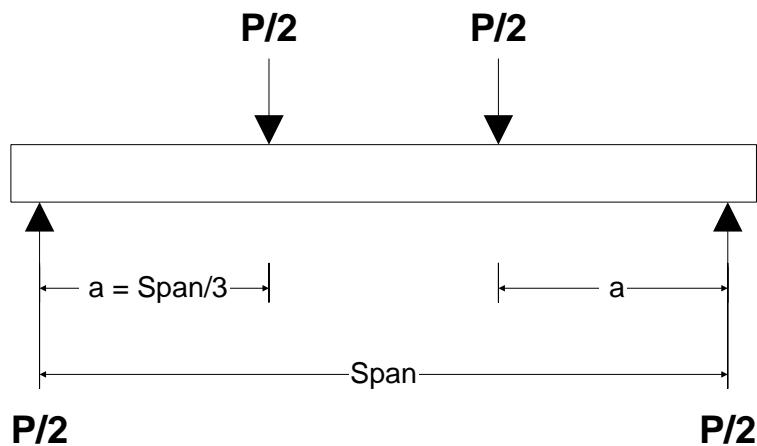

Figure 1. Schematic diagram of edgewise bending test

Table 4. Test configuration for edgewise bending tests

Type	Nominal Depth (inch)	Span L (in.)	a (in.)	Span/Depth
UBA and TBA	3-1/2	63	21	18.0 : 1
UBH1 and TBH1	3-1/2	60	20	17.1 : 1
UBH2 and TBH2	5-1/2	90	30	16.4 : 1
UBH3 and TBH3	7-1/4	126-3/4	42-1/4	17.5 : 1
UBH4 and TBH4	9-1/4	162	154	17.5 : 1

The modulus of rupture (MOR) and the modulus of elasticity (MOE) for each specimen were calculated using the actual dimensions recorded at the time of test based on the following equations:

$$MOR = \frac{3 P_{ult} a}{b h^2} \quad \dots \dots \dots \quad (1)$$

$$MOE = \frac{\theta a (3 L^2 - 4 a^2)}{4 b h^3} \quad \dots \dots \dots \quad (2)$$

Where:

- MOR = modulus of rupture (psi)
- MOE = apparent modulus of elasticity (psi)
- $P_{ult}$  = ultimate total load excluding the dead weight of the specimens (lbf)
- $a$  = distance between the reaction point to the nearest loading point (in.)
- $b$  = measured beam width (in.)
- $h$  = measured beam depth (in.)
- $L$  = test span (in.), and
- $\theta$  = slope of load vs. deflection plot below the proportional limit (lbf/in.)

### 4.3 Edgewise Block Shear Tests

Longitudinal shear strength in the L-Y plane (edgewise or joist orientation) was tested by conducting block shear tests in accordance with ASTM D5456 and D143. Untreated (USA) and treated (TSA and TSH) samples were tested under both standard and hygrothermal conditions.

### 4.4 Gluebond Durability Tests

Gluebond durability of the untreated LVL was tested in accordance with the six-cycle short-span bending test method of Section A4.2 of ASTM D5456. The specimens were subjected to six vacuum-pressure-soak cycles and in the final cycle, they were dried to a moisture content that was within  $\pm 2\%$  of the control group. The specimens were then tested in a flatwise short-span bending configuration.

## 5. Results and Discussion

### 5.1 Tension

Tension test results are summarized in Table 5. Individual test results are given in Appendix A.

Table 5. Summary of tension test results for untreated and treated specimens

	UTA	TTA	UTH	TTH
Number of specimens	32	32	32	32
Mean (psi)	6,968	6,174	6,617	5,718
Maximum (psi)	7,988	7,332	7,795	6,954
Minimum (psi)	6,048	4,974	5,049	4,500
COV	0.069	0.096	0.096	0.097
LTL (normal distribution) (psi)	6,078	5,068	5,432	4,682
LTL (lognormal distribution) (psi)	6,120	5,129	5,477	4,730

## 5.2 Edgewise Bending

Results of the edgewise bending tests are summarized in Tables 6 through 8. Individual test results are given in Appendix B.

Table 6. Summary of edgewise bending properties under standard conditions

	UBA		TBA	
	MOE	MOR	MOE	MOR
Number of specimens	32	32	32	32
Mean (psi)	$2.11 \times 10^6$	10,076	$1.93 \times 10^6$	9,017
Maximum (psi)	$2.25 \times 10^6$	12,313	$2.03 \times 10^6$	10,550
Minimum (psi)	$2.00 \times 10^6$	8,110	$1.82 \times 10^6$	7,754

LTL (lognormal distribution) (psi)	7,568	6,539	6,446	5,118

<sup>(a)</sup> MOE data were not available.

### 5.2.1 Bending Volume Effect

The bending volume effect parameter ( $K_d$ ) takes the form of:

$$K_d = \left( \frac{d_1}{d} \right)^{2/m} = \left( \frac{d_1}{d} \right)^{1/n} \dots \dots \dots \quad (3)$$

Where:

$K_d$	=	volume effect parameter
$d_1$	=	base depth (inches)
$d$	=	any depth (inches)
$n$	=	$m/2$ coefficient determined following Annex A1, ASTM D5456
	=	4.8 (UBH) and 4.1 (TBH) based on the empirical procedure
	=	7.3 (UBH) and 7.8 (TBH) based on theoretical procedure.

The volume effect parameter was determined following Annex A1 of ASTM D5456. The base bending depth was 3.5 inches. Figures 2 and 3 are plots of both the empirical (following least-square regression technique per section A1.4.2 of ASTM D5456) and the theoretical (as determined by lower-tail Weibull analysis as covered in section A1.4.3 of ASTM D5456) bending volume effect parameters. The empirical procedure for determining the volume effect exponent "n" was deemed "acceptable" based on Sections A1.4.5 and A1.4.5.1 of ASTM D5456.

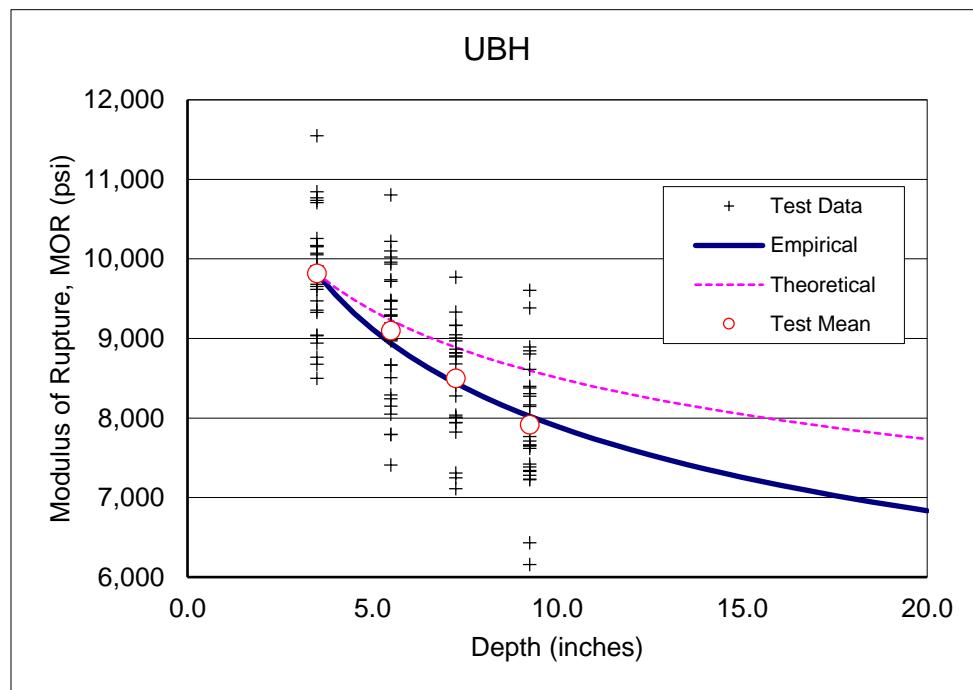

Figure 2. Empirical and theoretical edgewise bending volume effect for untreated specimens

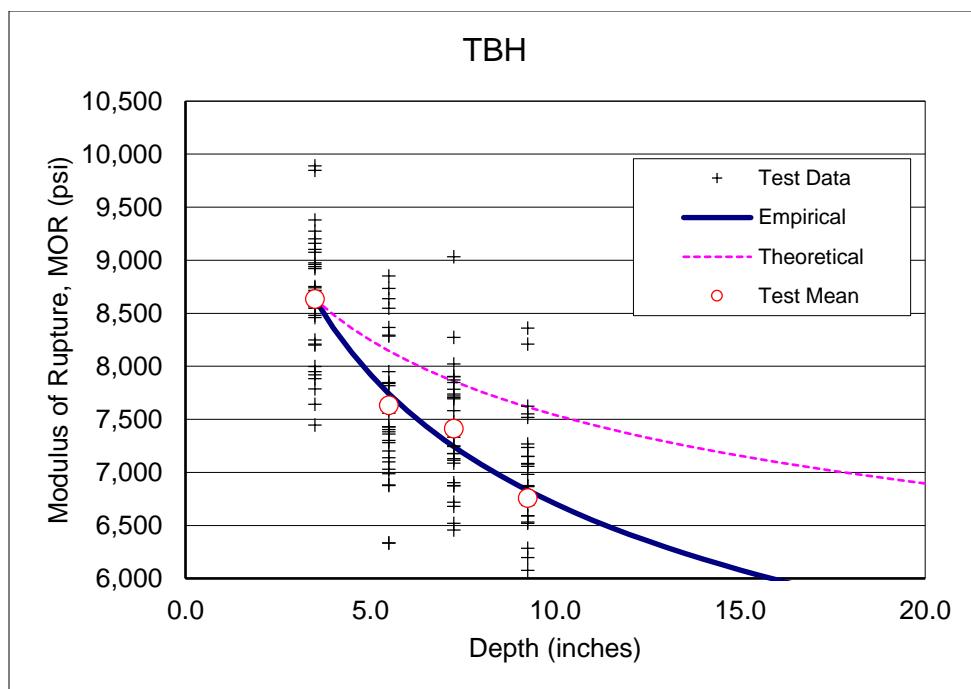

Figure 3. Empirical and theoretical edgewise bending volume effect for treated specimens

Based on APA Technical Report T2008P-113, factor  $n$  in the edgewise bending volume effect parameter  $K_d$  ( $K_d = (d_1/d)^{1/n}$ ) for untreated 3,100F<sub>b</sub>-2.0E LVL under standard conditions is 5.4. From this study,  $n$  is 4.8 and 4.1 for untreated (UBH) and treated (TBH) 3,100F<sub>b</sub>-2.0E LVL under hygrothermal conditions, respectively. The average edgewise bending MOR for untreated and treated samples under standard and hygrothermal conditions are listed in Table 9 and shown in Figure 4. The average bending strength decreased for about 7 to 11 percent for untreated samples after hygrothermal treatment. Then it decreased again for 12 to 16 percent after the fire-retardant treatment.

Table 9. Average edgewise bending MOR

Depth (in.)	Untreated MOR (psi) under standard conditions	Untreated MOR (psi) under hygrothermal conditions	Untreated MOR under hygrothermal conditions/ Untreated MOR under standard conditions	Treated MOR (psi) under hygrothermal conditions/ Untreated MOR under hygrothermal conditions	Treated MOR (psi) under hygrothermal conditions/ Untreated MOR under hygrothermal conditions	Treated MOR under hygrothermal conditions/ Untreated MOR under standard conditions
2-1/2	11,461	--	--	--	--	--

LTL (lognormal distribution) (psi)	838	702	677

### 5.4 Adhesive Durability (Six-Cycle Short Span Bending)

Detailed test results for adhesive durability tests on untreated LVL are provided in Appendix D. The ratio of the average cycled failure load divided by the control failure load was 0.89.

## 5.5 Combined FRT and Hygrothermal Effects

Fire-retardant treatment and hygrothermal effects for tension, bending, and shear properties are listed in Tables 11 through 14.

Table 11. Fire-retardant treatment effect under standard conditions

	Tension		Edgewise Bending MOR		Edgewise Bending MOE		Edgewise Block Shear

K for 5 <sup>th</sup> percentile with 75% confidence				1.860
Lower tolerance limit (LTL)				676
LTL/3.15				215

LVL edgewise block shear tests (TSH)

Material: 1-3/4" 3,100Fb-2.0E LVL (P49 treated)

Test lab: Forest Products Laboratory, Madison, WI

Conditions: Hygrothermal conditioning and re-conditioned to standard conditions

Combined Statistics

	Shear Strength
No. of tests	156
Mean	813
Maximum	1,001
Minimum	585
COV	0.101
K for 5 <sup>th</sup> percentile with 75% confidence	1.734
Lower tolerance limit (LTL)	671 <sup>(a)</sup>
TL/3.15	213

<sup>(a)</sup> Based on a normal distribution (677 psi based on a lognormal distribution).

## **Appendix D. Adhesive Durability Test Results**

LVL adhesive durability tests

Material: 1-3/4" 3,100Fb-2.0E LVL (UBA, untreated)

Test lab: APA Research Center, Tacoma, WA

Specimen Number	Failure Load (lbf)	Moisture Content (%)	Width in.	Thickness in.	Shear Strength psi
Control Specimens					
1	2,375	5.5	1.688	1.750	402
2	2,408	5.6	1.688	1.750	408
3	3,083	5.7	1.688	1.750	522
