1. Basis of the product report:
   - 2012 IRC: Sections R502.1.5, R602.1.2, and R802.1.4 Structural glued laminated timber
   - ANSI 117-2020 and ANSI 117-2015 recognized in the 2021 IBC and IRC, and 2018 IBC and IRC, respectively
   - ASTM D3737-18e1, D3737-12, and D3737-08 recognized in the 2021 IBC and IRC, 2018 and 2015 IBC and IRC, and 2012 IBC and IRC, respectively
   - Qualification test data

2. Product description:
   Vaagen glulam products are manufactured with Douglas fir-Larch lumber in accordance with ANSI A190.1. These layup combinations are recognized in ANSI 117. Vaagen glulam products are used as beams, headers, rafters, purlins, and columns, and are manufactured in nominal widths up to 12 inches, depths up to 48 inches, and lengths up to 60 feet. In addition, Vaagen glulam products are used as vertically glued laminated decking with nominal depths up to 12 inches, widths up to 48 inches, and lengths up to 60 feet.

3. Design properties:
   Allowable design properties for Vaagen glulam beams and columns are listed in Tables 1 and 2. The allowable spans for Vaagen glulam beams shall be in accordance with the recommendations provided by the manufacturer and APA Data File: Glued Laminated Beam Design Tables, Form S475 (www.apawood.org/resource-library), as applicable, or shall be determined based on the design properties listed in Table 1, as appropriate. The allowable loads for Vaagen glulam columns shall be in accordance with the recommendations provided by the manufacturer and APA Data File: Design of Structural Glued Laminated Timber Columns, Form Y240 (see link above), as applicable, or shall be determined based on the design properties listed in Table 2, as appropriate.

4. Product installation:
   Vaagen glulam beams and columns shall be installed in accordance with the recommendations provided by the manufacturer and APA Construction Guide: Glulam Connection Details, Form T300 (see link above). Permissible field notching and drilling shall be in accordance with the recommendations provided by the manufacturer and APA Technical Notes: Field Notching and Drilling of Glued Laminated Timber Beams, Form S560, and Effect of Large Diameter Horizontal Holes on the Bending and Shear Properties of Structural Glued Laminated Timber, Form V700 (see link above).
5. Fire-rated assemblies:
   Design of fire-resistant exposed wood members in accordance with Chapter 16 of the National Design Specification for Wood Construction (NDS), Section 722.1 of the 2021, 2018, and 2015 IBC, or Section 722.6.3 of the 2012 IBC shall be applicable to Vaagen glulam products. Fire-rated assemblies shall be constructed in accordance with the recommendations provided by the manufacturer and APA Design/Construction Guide: Fire-Rated Systems, Form W305 (see link above).

6. Limitations:
   a) Vaagen glulam beams and columns listed in this report shall be designed in accordance with the code using the design properties specified in this report.
   b) Vaagen glulam beams shall meet the dimensions specified in ANSI 117 and ANSI A190.1.
   c) Vaagen glulam beams and columns listed in this report are produced at the Vaagen Timbers, Colville, Washington facility under a quality assurance program audited by APA.
   d) This report is subject to re-examination in one year.

7. Identification:
   Vaagen glulam beams and columns listed in this report are identified by a label bearing the manufacturer's name (Vaagen Timbers) and/or trademark, the APA assigned plant number (1130), the product standard (ANSI A190.1), the APA logo, the combination symbol, the report number PR-L344, and a means of identifying the date of manufacture.

</table>

\(^{(1)}\) The combinations in this table are applicable to members consisting of 4 or more laminations and are intended primarily for members stressed in bending due to loads applied perpendicular to the wide faces of the laminations. Allowable design values are tabulated, however, for loading both perpendicular and parallel to the wide faces of the laminations.

\(^{(2)}\) The tabulated allowable design values are for normal duration of loading. For other durations of loading, see the applicable building code. The tabulated allowable design values are for dry conditions of use. For wet conditions of use, multiply the tabulated values by the wet-use factors shown at the bottom of the table.

\(^{(3)}\) DF = Douglas fir-Larch.

\(^{(4)}\) The unbalanced (U) layup is intended primarily for simple-span applications and the balanced (B) layup is intended primarily for continuous or cantilevered applications.

\(^{(5)}\) The values of F\(_{v}\) are based on members 5-1/8 inches in width by 12 inches in depth by 21 feet in length. For members with a larger volume, F\(_{v}\) shall be multiplied by a volume factor, C\(_{v}\) = (5.125/b)\(^{1/10}\) (12/d)\(^{1/19}\) (21/L)\(^{1/10}\), where b is the beam width (in.), d is the beam depth (in.), and L is the beam length between the points of zero moment (ft).

\(^{(6)}\) For non-prismatic members, members subject to impact or cyclic loading, or shear design of bending members at connections (NDS 3.4.3.3), the F\(_{v}\) and F\(_{w}\) values shall be multiplied by a factor of 0.72. The tabulated F\(_{v}\) values are for timbers with laminations made from a single piece of lumber across the width or multiple pieces that have been edge bonded. For timber manufactured from multiple piece laminations (across width) that are not edge bonded, value shall be multiplied by 0.4 for members with 5, 7, or 9 laminations or by 0.5 for all other members.

\(^{(7)}\) The tabulated E values include true E (also known as "shear-free E"), apparent E, and E for beam stability calculation (NDS 3.3.3.8). For calculating beam deflections, the tabulated E\(_{app}\) values shall be used unless the shear deflection is determined in addition to bending deflection based on the tabulated E\(_{true}\). The axial modulus of elasticity, E\(_{axial}\) and E\(_{axial}\), shall be equal to the tabulated E\(_{true}\) and E\(_{app}\) values.

\(^{(8)}\) The values of F\(_{v}\) are based on members 12 inches in depth. For depths less than 12 inches, F\(_{v}\) shall be permitted to be increased by multiplying by the flat use factor, (12/d)\(^{1/3}\), where d is the beam depth in inches. When d is less than 3 inches, use the size adjustment factor for 3 inches.

APA – The Engineered Wood Association is an approved national standards developer accredited by American National Standards Institute (ANSI). APA publishes ANSI standards and Voluntary Product Standards for wood structural panels and engineered wood products. APA is an accredited certification body under ISO/IEC 17065 by Standards Council of Canada (SCC), an accredited inspection agency under ISO/IEC 17020 by International Code Council (ICC) International Accreditation Service (IAS), and an accredited testing organization under ISO/IEC 17025 by IAS. APA is also an approved Product Certification Agency, Testing Laboratory, Quality Assurance Entity, Validation Entity, and Product Evaluation Entity by the State of Florida, and an approved testing laboratory by City of Los Angeles.
