1. Basis of the product report:
   - 2012 IRC: Sections R502.1.5, R602.1.2, and R802.1.4 Structural glued laminated timber
   - ANSI 117-2020 and ANSI 117-2015 recognized in the 2021 IBC and IRC, and 2018 IBC and IRC, respectively
   - ASTM D3737-18e1, D3737-12, and D3737-08 recognized in the 2021 IBC and IRC, 2018 and 2015 IBC and IRC, and 2012 IBC and IRC, respectively
   - Qualification test data

2. Product description:
   Alamco glulam products are manufactured with Douglas fir-Larch, Southern pine, Alaska Cedar, and Western Red Cedar lumber in accordance with ANSI A190.1. These layup combinations are recognized in ANSI 117. Alamco glulam products are used as beams, purlins, rafters, headers, truss members, columns, and custom curved shapes such as Tudor arches, barrel roof designs, and other end uses. Alamco manufactures standard industry sizes and custom sizes up to 31-1/4 inches in width, 72 inches in depth, and 134 feet in length.

3. Design properties:
   Allowable design properties for Alamco glulam beams and columns are listed in Tables 1 and 2. The allowable spans for Alamco glulam beams shall be in accordance with the recommendations provided by the manufacturer and APA Data File: Glued Laminated Beam Design Tables, Form S475 (www.apawood.org/resource-library), as applicable, or shall be determined based on the design properties listed in Table 1, as appropriate. The allowable loads for Alamco glulam columns shall be in accordance with the recommendations provided by the manufacturer and APA Data File: Design of Structural Glued Laminated Timber Columns, Form Y240 (see link above), as applicable, or shall be determined based on the design properties listed in Table 2, as appropriate.

4. Product installation:
   Alamco glulam beams and columns shall be installed in accordance with the recommendations provided by the manufacturer and APA Construction Guide: Glulam Connection Details, Form T300 (see link above). Permissible field notching and drilling shall be in accordance with the recommendations provided by the manufacturer and APA Technical Notes: Field Notching and Drilling of Glued Laminated Timber Beams, Form S560, and Effect of Large Diameter Horizontal Holes on the Bending and Shear Properties of Structural Glued Laminated Timber, Form V700 (see link above).
5. Fire-rated assemblies:
   Design of fire-resistant exposed wood members in accordance with Chapter 16 of the National Design Specification for Wood Construction (NDS), Section 722.1 of the 2021, 2018, and 2015 IBC, or Section 722.6.3 of the 2012 IBC shall be applicable to Alamco glulam beams and columns. Fire-rated assemblies shall be constructed in accordance with the recommendations provided by the manufacturer and APA Design/Construction Guide: Fire-Rated Systems, Form W305 (see link above).

6. Limitations:
   a) Alamco glulam beams and columns listed in this report shall be designed in accordance with the code using the design properties specified in this report.
   b) Alamco glulam beams shall meet the dimensions specified in ANSI 117 and ANSI A190.1.
   c) Alamco glulam beams and columns listed in this report are produced at the Alamco Wood Products, Albert Lea, Minnesota facility under a quality assurance program audited by APA.
   d) This report is subject to re-examination in one year.

7. Identification:
   Alamco glulam beams and columns listed in this report are identified by a label bearing the manufacturer's name (Alamco Wood Products) and/or trademark, the APA assigned plant number (1009), the product standard (ANSI A190.1), the APA logo, the combination symbol, the report number PR-L345, and a means of identifying the date of manufacture.

</tbody>
</table>

**Notes:**

1. The combinations in this table are applicable to members consisting of 4 or more laminations and are intended primarily for members stressed in bending due to loads applied perpendicular to the wide faces of the laminations. Allowable design values are tabulated, however, for loading both perpendicular and parallel to the wide faces of the laminations.

2. The tabulated allowable design values are for normal duration of loading. For other durations of loading, see the applicable building code. The tabulated allowable design values are for dry conditions of use. For wet conditions of use, multiply the tabulated values by the wet-use factors shown at the bottom of the table.

3. DF = Douglas fir-Larch and SP = Southern pine.

4. The unbalanced (U) layup is intended primarily for simple-span applications and the balanced (B) layup is intended primarily for continuous or cantilevered applications.

5. The values of \( F_{wv} \) are based on members 5-1/8 inches in width by 12 inches in depth by 21 feet in length. For members with a larger volume, \( F_{wv} \) shall be multiplied by a volume factor, \( C_v = (5.125b)^{1/8} (12/d)^{1/5} (21/L)^{1/2} \) for DF or \( C_v = (5.125b)^{1/8} (12/d)^{1/5} (21/L)^{1/2} \) for SP, where \( b \) is the beam width (in.), \( d \) is the beam depth (in.), and \( L \) is the beam length between the points of zero moment (ft).

6. The values of \( F_{vy} \) for non-prismatic members, members subject to impact or cyclic loading, or shear design of bending members at connections (NDS 3.4.3.3), the \( F_{wv} \) and \( F_{vy} \) values shall be multiplied by a factor of 0.72. The tabulated \( F_{vy} \) values are for timbers with laminations made from a single piece of lumber across the width or multiple pieces that have been edge bonded. For timber manufactured from multiple piece laminations (across width) that are not edge bonded, value shall be multiplied by 0.4 for members with 5, 7, or 9 laminations or by 0.6 for all other members.

7. The tabulated \( E \) values include true \( E \) (also known as "shear-free \( E \)"), apparent \( E \), and \( E \) for beam stability calculation (NDS 3.3.3.8). For calculating beam deflections, the tabulated \( E_{axx} \) values shall be used unless the shear deflection is determined in addition to bending deflection based on the tabulated \( E_{comp} \). The axial modulus of elasticity, \( E_{axx} \) and \( E_{comp} \), shall be equal to the tabulated \( E_{axx} \) and \( E_{comp} \) values.

8. The values of \( F_{vy} \) are based on members 12 inches in depth. For depths less than 12 inches, \( F_{vy} \) shall be permitted to be increased by multiplying by the flat use factor, \( (12/d)^{1/5} \), where \( d \) is the beam depth in inches. When \( d \) is less than 3 inches, use the size adjustment factor for 3 inches.
Table 2. Allowable Design Values for Alamco Glulam Columns for Normal Duration of Load(1)

</table>

(1) The tabulated allowable design values are for normal duration of loading. For other durations of loading, see applicable building code. The tabulated allowable design values are for dry conditions of use. For wet conditions of use, multiply the tabulated values by the factors shown at the bottom of the table.

(2) SP = Southern pine.

(3) The tabulated E values include shear-free (true) modulus of elasticity (E_xtrue, E_ytrue, and E_ztrue), apparent modulus of elasticity (E_xapp and E_yapp), and 5th percentile modulus of elasticity (E_xth, E_yth, and E_zth). For column stability calculation (NDS 3.7.1), E_xth shall be used. For calculating the total deflection due to bending, the tabulated E_xapp or E_yapp values shall be used, or as an alternative, the true (shear-free) bending deflection shall be calculated using the tabulated E_xtrue or E_ytrue, which shall be added to the calculated shear deflection to determine the total deflection due to bending.

(4) The values of F_vx are based on members 12 inches in depth. For depths less than 12 inches, F_vx shall be permitted to be increased by multiplying by the flat use factor, (12/d)^0.5, where d is the beam depth in inches. When d is less than 3 inches, use the size adjustment factor for 3 inches.

(5) For non-prismatic members, notched members, members subject to impact or cyclic loading, or shear design of bending members at connections (NDS 3.4.3.3), the tabulated F_vx values shall be multiplied by 0.72.

(6) The tabulated F_vy values are for members of 4 or more lams. The tabulated F_vy values shall be multiplied by a factor of 0.95 for 3 lams and 0.84 for 2 lams. For members with 5, 7, or 9 lams manufactured from multiple-piece lams with unbonded edge joints, the tabulated F_vy values shall be multiplied by a factor of 0.4. For all other members manufactured from multiple piece lams with unbonded edge joints, the tabulated F_vy values shall be multiplied by a factor of 0.5. This adjustment shall be cumulative with the adjustment specified in Footnote 5.

(7) The values of F_ax are based on members 5-1/8 inches in width by 12 inches in depth by 21 feet in length. For members with a larger volume, F_ax shall be multiplied by a volume factor, C_v = (5.125b)^(0.20) (12/d)^(0.5) (21L)^(0.5), where b is the beam width (in.), d is the beam depth (in.), and L is the beam length between the points of zero moment (ft).

(8) The tabulated F_ax values are for members without special tension lams up to 15 inches in depth. If the member depth is greater than 15 inches without special tension lams, the tabulated F_ax values must be multiplied by a factor of 0.88. If special tension lams are used, the tabulated F_ax values are permitted to be increased by a factor of 1.18 regardless of the member depth provided that the increased F_ax value does not exceed 2,400 psi. This factor shall be cumulative with the volume factor, C_v, specified in Footnote 7.
APA – The Engineered Wood Association is an approved national standards developer accredited by American National Standards Institute (ANSI). APA publishes ANSI standards and Voluntary Product Standards for wood structural panels and engineered wood products. APA is an accredited certification body under ISO/IEC 17065 by Standards Council of Canada (SCC), an accredited inspection agency under ISO/IEC 17020 by International Code Council (ICC) International Accreditation Service (IAS), and an accredited testing organization under ISO/IEC 17025 by IAS. APA is also an approved Product Certification Agency, Testing Laboratory, Quality Assurance Entity, Validation Entity, and Product Evaluation Entity by the State of Florida, and an approved testing laboratory by City of Los Angeles.
